Abstract

1 - Coastal lagoons are particular ecosystems, since they are ecotones between terrestrial, freshwater and marine ecosystems, being characterized by a high temporal variability. Because of these characteristics, coastal lagoons have very peculiar abiotic and biotic conditions that require investigation if we are to understand their complex ecological functions. In this study, a list of invertebrate species from coastal lagoons in the Balearic archipelago is provided in order to enhance the knowledge of their aquatic fauna. This study reports on the existence of 123 species, from 135 genera and 24 families. The most common taxa were *Chironomus* spp. (Meigen, 1803) and *Halocladius* spp. (Hirvenoja, 1973) (Diptera, Chironomidae), *Hydrobia ventrosa* (Montgau, 1803) (Gastropoda, Hydrobiidae), *Cyprideis torosa* (Jones, 1850) (Ostracoda, Cytherideidae), *Lekanesphaera hookeri* (Leach, 1814) (Isopoda, Sphaeromatidae) and Naididae (Oligochaeta).

Keywords: coastal lagoons, Balearic Islands, invertebrates, taxonomic list

Introduction

The study of biological diversity is necessary for the conservation and sustainable management of natural resources, as was declared by the Convention on Biological Diversity in Rio de Janeiro (1992). Knowledge of taxonomic diversity is a fundamental requisite to conserve any ecosystem. This is especially true for the conservation of vulnerable ecosystems, such as coastal lagoons. In particular, the composition of aquatic invertebrate communities in coastal lagoons is relatively poorly known, and most

of the management efforts are focused on the conservation of a small number of species, primarily water-birds (Boix et al., 2008). In the case of Balearic Islands, coastal lagoons are the most important reservoirs of water, after ground water. Thus, basic studies that document biota in these ecosystems are of great importance.

Coastal lagoons are ecotones between freshwater, marine and terrestrial ecosystems, and are highly dynamic environmentally (i.e. chemistry of the system) and biotically (i.e., biological community) (Zaldívar et

al., 2008; Joyce *et al.*, 2005). Coastal lagoon communities are generally considered to be comprised of opportunistic and specialist species derived from freshwater, marine and brackish sources (Barnes, 1988). In the case of the Balearic Islands, taxonomic studies of aquatic invertebrates have been focused on specific taxonomic groups and there are few comprehensive and extensive studies dealing with the whole community. The majority of taxonomic lists were produced by natural parks managers, works derived from PhDs or official reports (e.g., Pretus, 1991; Riddiford, 1998 and references therein, Boix *et al.*, 2009). In the present study, we aim to improve the knowledge of the invertebrate species from coastal lagoons in the Balearic Islands. With this objective, a list of invertebrate species found in 34 permanent coastal lagoons is provided. This is the first research to document the invertebrate community from such a high number of natural permanent coastal lagoons in the four main islands of the Balearic archipelago (Majorca, Minorca, Ibiza and Formentera).

Material and Methods

Study Area

The Balearic Islands are located in the Eastern Mediterranean Sea, characterized by dry summers and mild winters, with the most important rainfall occurring during fall and spring (Britton & Crivelli, 1993). We have selected a network of sampling sites covering a wide range of abiotic conditions of the permanent coastal lagoons, including the four main islands of the Balearic archipelago: Majorca, Minorca, Ibiza and Formentera. Majorca is the largest island (3620.42 km²), followed by Minorca (694.40 km²), Ibiza (571.04 km²) and Formentera (82.49 km²). A total of 34 natural coastal lagoons were sampled between February and March 2008. Moreover, large and heterogeneous lagoons were divided into different sampling sites (up to six) (e.g., Albufera de Mallorca: 6 sampling sites; Albufera des Grau: 3 sampling sites) in order to collect the maximum number of species. A list of the coastal lagoons is provided in Table 1 and their locations in Figure 1.

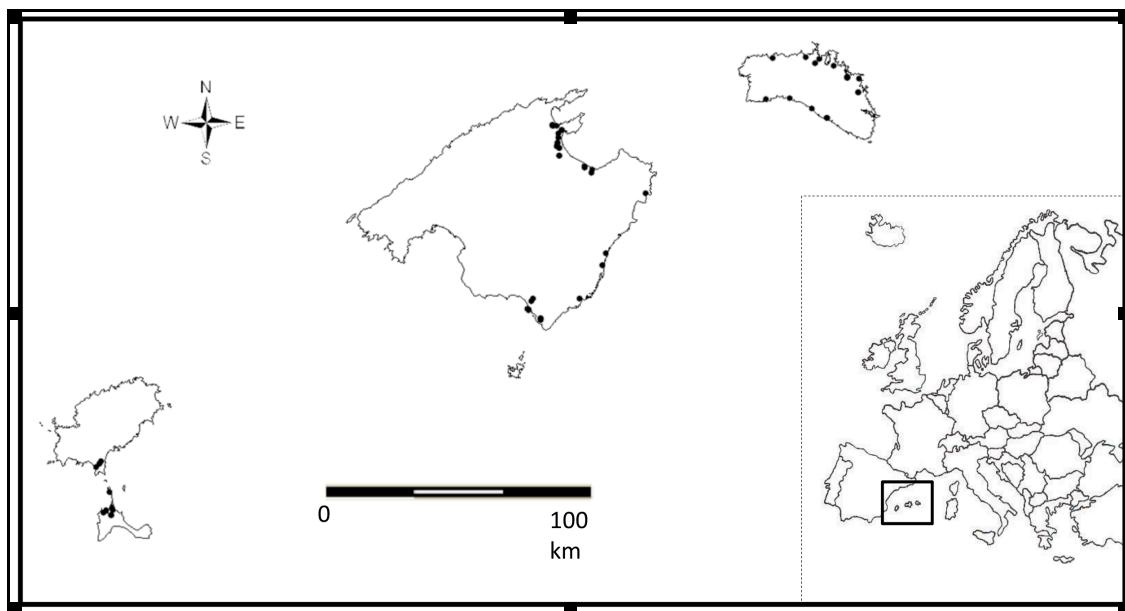

Figure 1. Map of the Balearic Islands where the location of the studied coastal lagoons is shown (black points).

Table 1 - List of coastal lagoons studied with the corresponding number codes. The sample code number used, the name of the coastal lagoon, the island, the samplers (PLM: Paloma Lucena-Moya; BHA: Begoña Hermida Andrade), the date and the UTM coordinates (zone 30) are shown. Prat i Salines de Mongofre (Addaia) is the name given for three different but very close coastal lagoons, so numbers 35, 36, 37 have the same name but relate to different sampling sites. Tank 1= heater, tank 2= crystallizer and tank 3= evaporator were differentiated in the case of the saltworks.

Biological sampling and identification

Invertebrate samples were collected using a sweep net (0.25 x 0.25 m frame net, 250 µm sieve), and following a protocol based on the multi-habitat survey (Briers and Biggs, 2005; Barbour et al., 1999). We took 20 "sweeps" of 0.5 m, so the total area sampled was 2.5 m² (0.25*0.5*20). The sampling was carried out in a littoral band (ca. 50 x 3 m) of each coastal lagoon; samples were preserved in 70% ethanol, and once in the laboratory they were sorted using sieves of different pore size (5 mm, 1 mm and 0.1 mm). All invertebrates were identified to genus or species except for some taxa of Diptera, Oligochaeta, Polychaeta, Acari and Lepidoptera that were identified to family level, and Nematoda that remained as class. Moreover, some individuals were identified to family level because their small size did not allow a higher taxonomic resolution (e.g., some individuals of Odonata or Heteroptera orders). An Olympus U-TV1X 40X compound and Nikon SMZ645 5X dissecting microscope were used for the identification (see Lucena-Moya et al., 2009 for further details).

Results and discussion

The invertebrates found in the coastal lagoons of the Balearic Islands are listed below. The list is ordered by phylogenetic hierarchical taxonomic order following Fauna Ibérica (CSIC, 2004-2009). Species nomenclature was based on the following data bases: Integrated Taxonomic Information System (ITIS) (National Museum of Natural History Washington, D.C., 2009), the species 2000 & ITIS Catalogue of Life (Bisby et al., 2009), ZipcodeZoo (The Bay Science Foundation 2004-2008) and The World Register of Marine Species (WORMS) (Appeltans et al., 2009). In the taxonomic list, numbers in brackets correspond to the coastal lagoon where the taxa were found. The correspondence between each number code and coastal lagoon identity

is shown in Table 1.

The study records the presence of 123 species corresponding to 135 genera and 24 families. The commonest taxa were Chironomus spp. (Diptera, Chironomidae) present in 24 localities (55% of total), Halocladius spp. (Diptera, Chironomidae) (22 localities, 50%), Hydrobia ventrosa (Gastropoda, Hydrobiidae) (19 localities, 43%), Cyprideis torosa (Ostracoda, Cytherideidae) (17 localities, 39%), Lekanesphaera hookeri (Isopoda, Sphaeromatidae) (15 localities, 34%) and Naididae (Oligochaeta) (14 localities, 32%).

All taxa are characteristic of brackish waters. These results are in agreement with the higher percentage of coastal lagoons of intermediate salinity (i.e., mesohaline: 6-30‰) in the Balearic Islands, since 42.62% of the sampling sites are mesohaline, 32.79% are euhaline (>30‰) and 24.59% are oligohaline (<5‰) (Lucena-Moya et al., 2009). The coastal lagoons with higher species richness were those with higher numbers of microhabitats such as the Albufera de Mallorca (73 taxa), Prat i Salines de Mongofre (33 taxa), Albufera des Grau (27 taxa), Albufereta de Pollença (22 taxa). Our results are in agreement with positive relationships reported between species richness and the number of available habitats observed for a variety of other taxa and habitats (e.g., Stewart et al., 2000). High richness also corresponded to coastal lagoons with low salinity content, such as Gola de Cala en Porter (31 taxa), Albufera de Mercadal - Son Saura (Nord) (29 taxa), Gola i maresme de Binimel·là (29 taxa), Prat de Son Bou (22 taxa), Prat de Bellavista - Son Saura (Sud) (21 taxa).

The inverse relationship between salinity and number of taxa has also been broadly reported (Williams et al., 1990; Williams, 1998). Finally, high species richness was also observed in euhaline coastal lagoons

in good conservation status, such as Font de Nalis (21 taxa) and Ses Gambes (20 taxa).

Species richness in the remaining coastal lagoons ranged between 1 and 19 taxa.

Hermanax ephippiger (Burmeister, 1839) (9, 12, 21, 26, 33, 34)

Family LIBELLULIDAE

Orthetrum brunneum (Fonscolombe, 1837) (14, 27, 32)
Orthetrum cancellatum (Linnaeus, 1758) (9, 14, 27, 30)
Crocothemis erythraea (Brullé, 1832) (9, 26, 34)
Sympetrum flaveolum (Linnaeus, 1758) (33)
Sympetrum fonscolombei (Selys, 1841) (21)

Order EPHEMEROPTERA**Family BAETIDAE**

Cloeon dipterum (Linnaeus, 1761) (27, 32)
Cloeon simile Eaton, 1870 (9, 21, 26, 32, 34, 38)

Order HETEROPTERA**InfraOrder GERROMORPHA****SuperFamily GERROIDEA****Family HYDROMETRIDAE**

Hydrometra stagnorum (Linnaeus, 1758) (34)

InfraOrder NEPOMORPHA**SuperFamily NOTONECTOIDEA****Family NOTONECTIDAE**

Anisops sardus Herrich-Schäffer, 1849 (9)
Notonecta viridis Delcourt, 1909 (9)

Family PLEIDAE

Plea minutissima Leach, 1817 (33, 34)

SuperFamily NAUCOROIDEA**Family NAUCORIDAE**

Naucoris maculatus Fabricius, 1798 (9)

SuperFamily CORIXOIDEA**Family CORIXIDAE****SubFamily CORIXINAE**

Corixa spp. Geoffroy, 1762 (31, 35)
Corixa affinis Leach, 1817 (32)
Sigara spp. Fabricius, 1775 (9, 35)
Sigara lateralis Leach, 1817 (38)
Sigara selecta (Fieber, 1848) (24, 22EV)
Sigara stagnalis (Leach, 1817) (10, 18, 21, 29, 35)

Order COLEOPTERA**InfraOrder ADEPHAGA****Family GYRINIDAE**

Gyrinus spp. Ad. Geoffroy, 1762 (38)
Gyrinus caspius cf. (34)

Family HALIPLIDAE

Halipplus (Neohalipplus) lineatocollis (Marsham, 1802) (30, 35)
Halipplus (Halipplus) fluviatilis Aubé, 1836 (33)

Family NOTERIDAE

Noterus laevis Sturm, 1834 (9, 26, 29, 30, 31, 34)

Family DYTISCIDAE**SubFamily LACCOPHILINAE**

Laccophilus spp. Lv Leach, 1815 (29, 31)

SubFamily HYDROPORINAE

Hydrovatus cuspidatus (Kunze, 1818) (29, 31)
Hydroporus spp. Lv. Clairville, 1806 (10, 24)
Hydroporus pubescens (Gyllenhal, 1808) (10, 24)
Hydroporus tessellatus Drapiez, 1819 (34)
Scarodytes spp. Lv. Gozis, 1914 (35, 36, 23EV)
Stictonectes spp. Lv Brinck, 1943 (9)
Deronectes spp. Lv. Sharp, 1882 (15)
Deronectes moestus (Leprieur, 1874) (9)
Nebrioporus spp. Lv./Ad. Régimbart, 1906 (5, 20, 21, 35)
Nebrioporus (Zimmermannius) *ceresi* (Aubé, 1836) (2, 5, 7CR, 18, 20, 22CA, 23EV, 24, 35)

SubFamily COLYMBETINAE

Rhantus (*Rhantus*) *frontalis* cf. (9)

Meladema spp. Lv. Laporte, 1835 (10)

- SubFamily DYTISCINAE**
Cybister (Scaphinectes) lateralimarginalis (De Geer, 1774) (9)
- InfraOrder POLYPHAGA**
- Family HELOPHORIDAE**
Helophorus (Rhopalohelophorus) dorsalis Marsham, 1802
 (35, 36)
- Family HYDROPHILIDAE**
Berosus spp. Lv./Ad. Leach, 1817 (4, 9, 10, 18, 20, 22EV, 23EV, 24, 25, 27, 33, 35)
Berosus (Berosus) affinis Brullé, 1835 (9, 33, 35, 1EV)
Berosus (Berosus) signaticollis (Charpentier, 1825) (33)
Berosus (Enoplurus) cf. spinosus (4, 35)
Berosus (Enoplurus) fulvus Kuwert, 1888
Paracynus aeneus (Germar, 1864) (18, 35, 36)
Anacaena spp. Ad. Thomson, 1859 (34)
Laccobius spp. Lv. Erichson, 1837 (35)
Helochares lividus (Forster, 1771) (30)
Helochares punctatus Sharp, 1869 (26, 34)
Enochrus spp. Lv. Thomson, 1859 (35, 36)
Enochrus (Lumetus) bicolor (Fabricius, 1792) (3, 20, 23EV, 24, 25, 34, 35, 36)
Cymbiodyta marginella (Fabricius, 1792) (34)
Hydrobius fuscipes (Linnaeus, 1758) (35)
Limnoxenus niger (Zschach, 1788) (9)
- Family HYDRAENIDAE**
Ochthebius (Ochthebius) auriculatus cf. (20, 23)
Ochthebius (Ochthebius) corrugatus Rosenhauer, 1856 (5, 8, 18, 20, 22CA, 22EV, 23EV, 23CA)
- Family DRYOPIDAE**
Dryops spp. Ad. Olivier, 1791 (4)
Helichus spp. Lv. Erichson, 1847 (15)
- InfraOrder ELATERIFORMIA**
- Family SCIRTIDAE**
Hydrocyphon spp. Lv. Redtenbacher 1858 (4)
Cyphon spp. Lv. Paykull, 1799 (4)
- Order DIPTERA**
- InfraOrder NEMATOCERA**
- Family LIMONIIDAE** (9, 20, 26, 29, 31, 34)
- Family PSYCHODIDAE**
Pericomma spp. Walker, 1856 (4)
- Family DIXIDAE**
Dixella spp. Dyar & Shannon, 1924 (9, 21, 29, 31, 36)
- Family CULICIDAE**
Aedes spp. Meigen 1818 (18, 20, 22CA, 22EV, 24, 35)
- Family CERATOPOGONIDAE**
- SubFamily DASYHELEINAE**
Dasyhelea spp. Kieffer, 1911 (9, 10, 14, 17, 18, 20, 22EV, 29, 31, 35, 36, 38)
- Family CHIRONOMIDAE**
- SubFamily TANYPODINAE**
Procladius (Holotanypus) spp. Roback, 1982 (9, 10, 12, 14, 17, 19, 25, 27, 30, 35, 38)
Nilotanypus spp. Kieffer, 1923 (9, 26, 34)
Tanypus spp. Meigen, 1803 (29, 31)
- SubFamily ORTHOCLADIINAE**
Corynoneura spp. Winnertz, 1846 (9, 15, 26, 27, 29, 30, 31, 32, 34)
Cricotopus (Cricotopus) spp. van der Wulp, 1874 (9, 12, 15, 21, 25, 27, 34)
Halocladius (Halocladius) spp. Hirvenoja, 1973 (5, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 24, 25, 30, 32, 33, 35, 36, 37)
Psectrocladius (Psectrocladius) spp. Kieffer, 1906 (9, 13, 15, 26)
- SubFamily CHIRONOMINAE**
- Tribu CHIRONOMINI**
Baeotendipes spp. Kieffer, 1913 (1EV, 5, 9, 10, 18, 22CA, 23EV)
Chironomus spp. Meigen, 1803 (3, 5, 8, 9, 10, 11, 12, 3, 14, 16, 17, 20, 21, 22CA, 22EV, 23CA, 25, 27, 29, 30, 31, 32, 37, 38)
Chironomus (Chironomus) salinarius Kieffer in Thienemann, 1915 (2, 20)
Dicrotendipes spp. Kieffer, 1913 (35)
Kiefferulus spp. Goetghebuer, 1922 (9, 32)
Microtendipes spp. Kieffer, 1915 (15)

- Paratendipes* spp. Kieffer, 1911 (26)
Polypedilum spp. Kieffer, 1912 (9, 32)
- Tribu TANYTARSINI**
Micropsectra spp. Kieffer, 1909 (9)
Paratanytarsus spp. Thienemann & Bause, 1913 (9, 27, 32, 34)
- InfraOrder BRACHYCERA**
Family STRATIOMYIDAE
Nemotelus spp. Geoffroy, 1762 (8, 9, 10, 15, 18, 20, 21, 23EV, 24, 25, 34, 36)
Oxycera spp. Meigen, 1803 (34)
- Family TABANIDAE**
Tabanus spp. Linnaeus, 1758 (35)
- Family DOLICHOPODIDAE** (1EV, 15, 18, 20, 22CA)
- InfraOrder CYCLORRHAPHA**
Family SCIOMYZIDAE (18, 20)
Family EPHYDRIIDAE
Ephydria spp. Fallén, 1810 (2, 3, 7CA, 7CR, 8, 18, 22CA, 22EV, 22CR, 23CA, 24)
Scatella spp. Robineau-Desvoidy, 1830 (4, 35)
- Family MUSCIDAE** (19)
- Order TRICHOPTERA**
Family PSYCHOMYIIDAE
Lype phaeopa (Stephens, 1836) (9)
- Order LEPIDOPTERA**
Family PYRALIDAE (25)

Acknowledgements

The authors would like to thank C. Carabelos for helping with laboratory work, L. García and C. Delgado for field assistance and C. Gómez for improving the language and content of the paper. This research initiative was supported by the University of Vigo

and the Government of the Balearic Islands (Dirección General de Recursos Hídricos), through the project titled “Implementation of the Water Framework Directive in the Balearic Islands: evaluation of the environmental quality of the surface waters using biological indicators”.
